SAKAYLOCAL

COMMUNITY TRANSIT · FULL-STACK WEB APP

Your city. Your ride. Your way.

A local ride companion for finding Cebu terminals, checking trusted fares, and joining the queue with confidence.

Presented by
Angelie Pardillo

Project theme
Community transit, Cebu City

Stack
React · Laravel · MySQL

01 · THE IDEA

Transit information made easier to use.

SakayLocal brings useful local ride details into one calm, approachable dashboard designed around Cebu community transit.

Find a terminal

Search participating terminals, see current wait estimates, and join a queue before arriving.

Know the fare

Browse route fares with clear origin, destination, and approval status.

Track the request

Passengers follow their ticket while administrators move the queue through its workflow.

Design direction: friendly green tones, concise labels, responsive cards, and straightforward status feedback.

02 · FEATURES

Two roles. Clear responsibilities.

Passenger

- ✓ Create an account and sign in using a Sanctum token
- ✓ Search and filter terminals and fare routes
- ✓ Join a terminal queue and view ticket status
- ✓ Cancel a ticket while it is still pending

Administrator

- ✓ Create, edit, and delete terminals and fare routes
- ✓ Review queue requests and approve or complete them
- ✓ Admin actions are hidden in React and enforced by Laravel role middleware

QUEUE STATUS FLOW

Pending → **Approved** → **Completed**

> The API checks every transition and ownership rule. Invalid input returns field errors; forbidden actions return 403.

DATA FEATURES

Search · **Status filters** · **API pagination** · **Dashboard counts** · **Responsive layout**

A React SPA backed by a protected Laravel API.

REQUEST PATH

React 18
Router · Context
→
Axios
Bearer token
→
Laravel 12 API
Sanctum · Resources

Form Requests → **Eloquent models** → **MySQL / MariaDB**

> Sanctum tokens authenticate protected API requests. Middleware checks the administrator role before management actions.

CORE DATA TABLES

users
id · name · email · role

personal_access_tokens
tokenable · token · abilities

terminals
id · name · place · status · wait

fare_routes
origin FK · destination FK · fare

queue_entries
user FK · terminal FK · ticket · status

Foreign keys and Eloquent relationships keep terminals, routes, passengers, and queue tickets connected.

See the complete ERD →

04 · TECH STACK

Built with the required full-stack tools.

01

Frontend

React 18, Vite, React Router, Axios, functional components and hooks.

02

Backend

Laravel 12, PHP 8.2+, Sanctum tokens, Form Requests and API Resources.

03

Database

MySQL / MariaDB migrations, foreign keys, Eloquent relationships and seed data.

04

Quality

Responsive CSS, field validation, loading and error states, pagination and role checks.

START THE API

```
cd backend
composer install
php artisan migrate --seed
php artisan serve
```

START THE SPA

```
cd frontend
npm install
npm run dev
```

Set database credentials in backend/.env. Vite uses http://localhost:8000/api by default.

Ready for a local ride.

Seed the database to explore the passenger and administrator journeys with sample terminals, fares, and queue tickets.

DEMO ACCOUNTS

admin@sakaylocal.test
Password: password

user@sakaylocal.test
Password: password

Demo credentials are for local development only.

SEE THE PROJECT

- ✓ 22 seeded terminals and connected fare routes
- ✓ Passenger queue tickets and admin status controls
- ✓ Documented REST endpoints and database relationships
- ✓ Desktop and mobile-friendly dashboard pages

Thank you
